

Representing Colour

Go to the **Representing Colour** page on the website.

The program **colour-test.py** looks like this:

```
colour = rgb(255, 255, 0)
Pen(colour).rectangle(-100, -100, 100, 100)
```

If you run this program, you can see a square drawn in colour (255, 255, 0).

1. Complete the table below:

Colour	Hexadecimal code	Colour name
(255, 0, 0)	#FF0000	Red
(0, 255, 0)	#00FF00	Green
(0, 0, 255)	#0000FF	Blue
(255, 255, 0)	#FFFF00	
(255, 0, 255)		
(0, 255, 255)		

2. If each colour is made of three parts, and each part has 256 possible values (from 0 to 255), then how many possible colours are there in total?

3. Take a look at the program **colour-gradient.py**

This program creates a smooth gradient from black to green.

Edit the program to make a smooth gradient between the following colours:

- a) From black to red
- b) From blue to green
- c) From yellow to blue
